EnterpriseMouchel trial new LED lighting for Subways

EnterpriseMouchel's Continual Improvement and bringing Innovations and Cost savings to TfL continues with the introduction of the LED subway units. The LED units produce a brighter, cleaner light and will require less maintenance once fitted.

Another benefit these lights bring is that they can be fitted into the existing fittings. Thus reducing the need to manufacture new subway units and dispose of the old units bringing a saving in CO2 and Cost.

The units can be controlled remotely via a web based monitoring system so can be dimmed, switched off and monitored for outages.

These fittings meet the model for the Smart Lighting paper and is hoped that we have set the standard for future fittings to be converted in this way and bring CO2 and Energy cost savings to TfL.

These fittings were supplied free of charge to TfL by our supply chain partner Route Signs and were fitted free of charge by EnterpriseMouchel.
